

What is POP3?

The Post Office Protocol 3 (POP3 for short) is a method for receiving emails.

POP3 is a transmission protocol that allows an email client to fetch email from a server.

POP3 is the right choice if online time is important to you for cost reasons. With this procedure, the emails are always transmitted from the server to the local device. Even if you only receive and read your emails on a specific computer, you can use POP3 without hesitation.

However, if you want to manage emails online and access your email account from different devices, IMAP is the right choice.

IMAP is the recommended email format for businesses or teams, especially when you are using emails on multiple devices. We can set-up and offer advice on POP but on a request only basis.
